

# Class 9: Structural Bioinformatics (pt.1)

AUTHOR

Joseph Girgiss (PID: A17388247)

## The PDB Database

The main database for structural biology is called the PDB. Let's have a look at what it contains:

Download a CSV file from the PDB site (accessible from "Analyze" > "PDB Statistics" > "by Experimental Method and Molecular Type"

```
stats <- read.csv("~/Downloads/Data Export Summary.csv")
```

```
stats$Total
```

```
[1] "209,886" "13,718" "15,222" "4,840" "222" "22"
```

Oh, these are characters not numeric...

```
library(readr)
stats <- read_csv("~/Downloads/Data Export Summary.csv")
stats
```

| Molecular Type                                 | X-ray  | EM    | NMR   | Integrative | Multiple methods | Neutron |
|--|--------|-------|-------|-------------|------------------|---------|
| <chr>  | <dbl>  | <dbl> | <dbl> | <dbl>       | <dbl>            | <dbl>   |
| 1 Protein (only)                               | 176204 | 20299 | 12708 | 342         | 218              | 83      |
| 2 Protein/Oligosacch...                        | 10279  | 3385  | 34    | 8           | 11               | 1       |
| 3 Protein/NA                                   | 9007   | 5897  | 287   | 24          | 7                | 0       |

| 5 Other  | 173    | 13    | 33    | 3           | 0                | 0       |
| 6 Oligosaccharide (o...                        | 11     | 0     | 6     | 0           | 1                | 0       |
| # i 2 more variables: Other <dbl>, Total <dbl> |        |       |       |             |                  |         |

Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy?

```
n.total <- sum(stats$Total)
n.Xray <- sum(stats$`X-ray`)
n.EM <- sum(stats$EM)

xray_percent <- (n.Xray/n.total) * 100
cat(round(xray_percent, 2), "%\n")
```

81.48 %

```
em_percent <- (n.EM/n.total) * 100
cat(round(em_percent, 2), "%\n")
```

12.22 %

Q2: What proportion of structures in the PDB are protein?

```
protein_only_percent <- sum(stats$Total[1])/n.total * 100
cat(round(protein_only_percent, 2), "%\n")
```

86.05 %

```
n.protein_total <- sum(stats$Total[1:3])
protein_total_percent <- (n.protein_total/n.total) * 100
cat(round(protein_total_percent, 2), "%\n")
```

97.92 %

Q3: Type HIV in the PDB website search box on the home page and determine how many HIV-1 protease structures are in the current PDB?

There are 1,150 HIV-1 protease structures in the current PDB.

## Exploring PDB structures

Package for structural bioinformatics

```
library(bio3d)
hiv <- read.pdb("1hsg")
```

Note: Accessing on-line PDB file

```
hiv
```

Call: read.pdb(file = "1hsg")

Total Models#: 1  
Total Atoms#: 1686, XYZs#: 5058 Chains#: 2 (values: A B)

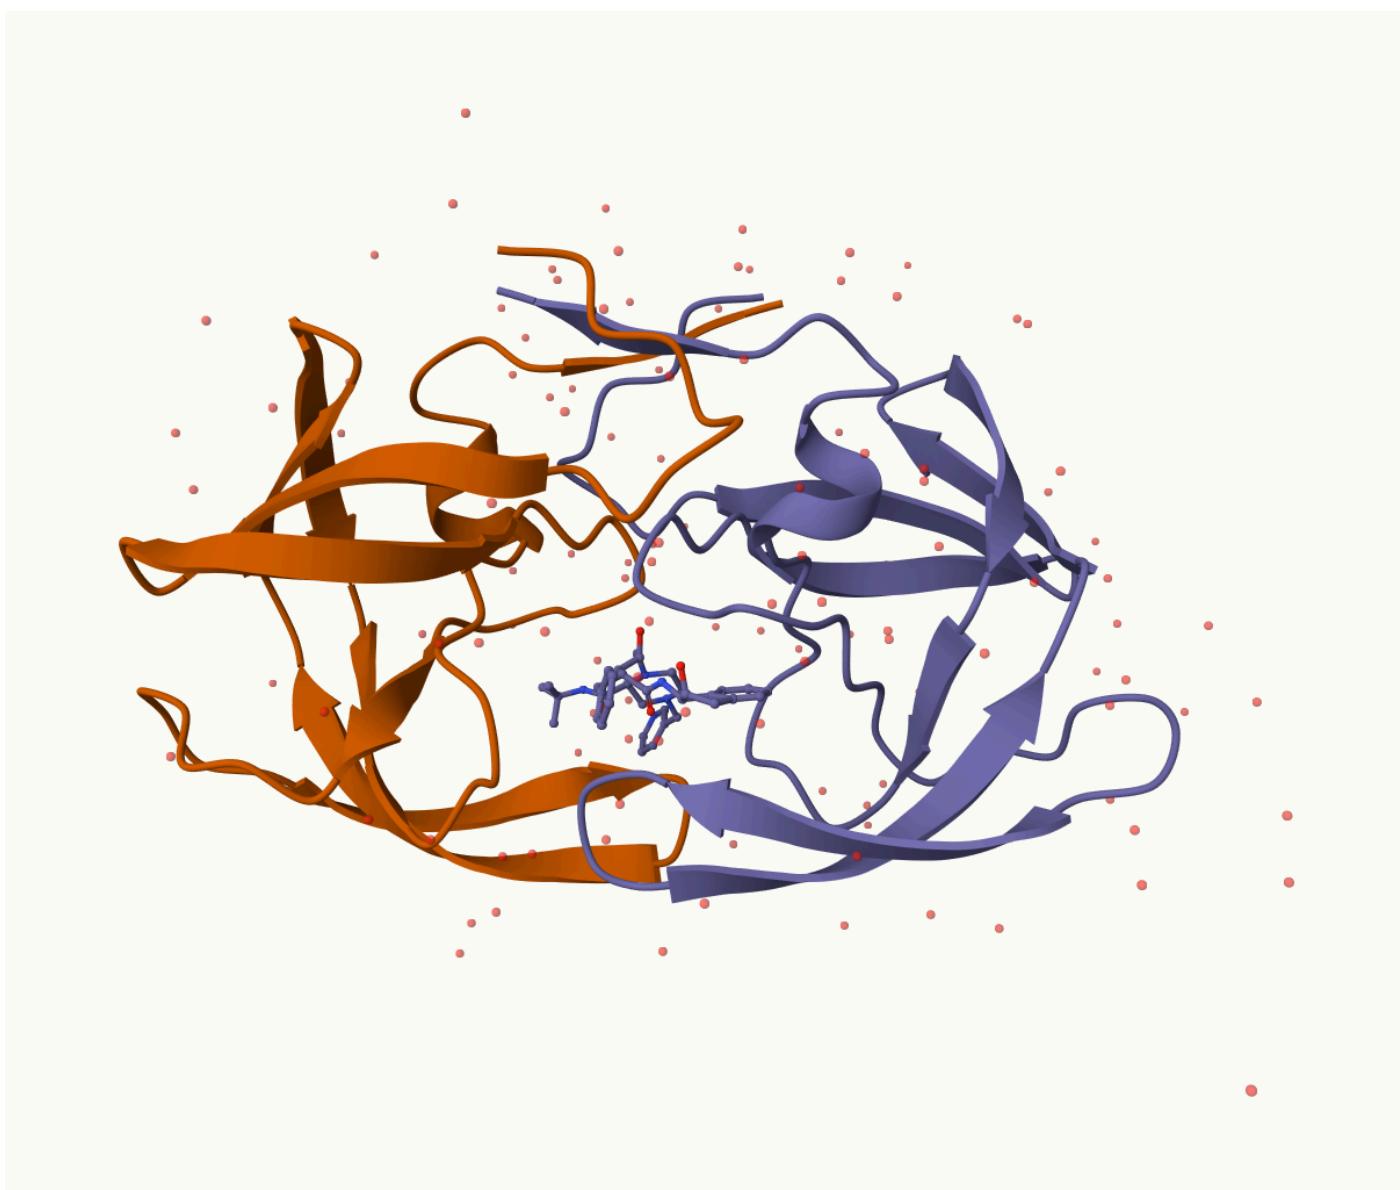

Protein Atoms#: 1514 (residues/Calpha atoms#: 198)  
Nucleic acid Atoms#: 0 (residues/phosphate atoms#: 0)

Non-protein/nucleic Atoms#: 172 (residues: 128)  
Non-protein/nucleic resid values: [ HOH (127), MK1 (1) ]

Protein sequence:

```
+ attr: atom, xyz, seqres, helix, sheet,
       calpha, remark, call
```

Let's first use the Mol\*viewer to explore this structure.

My first view of HIV-1 protease

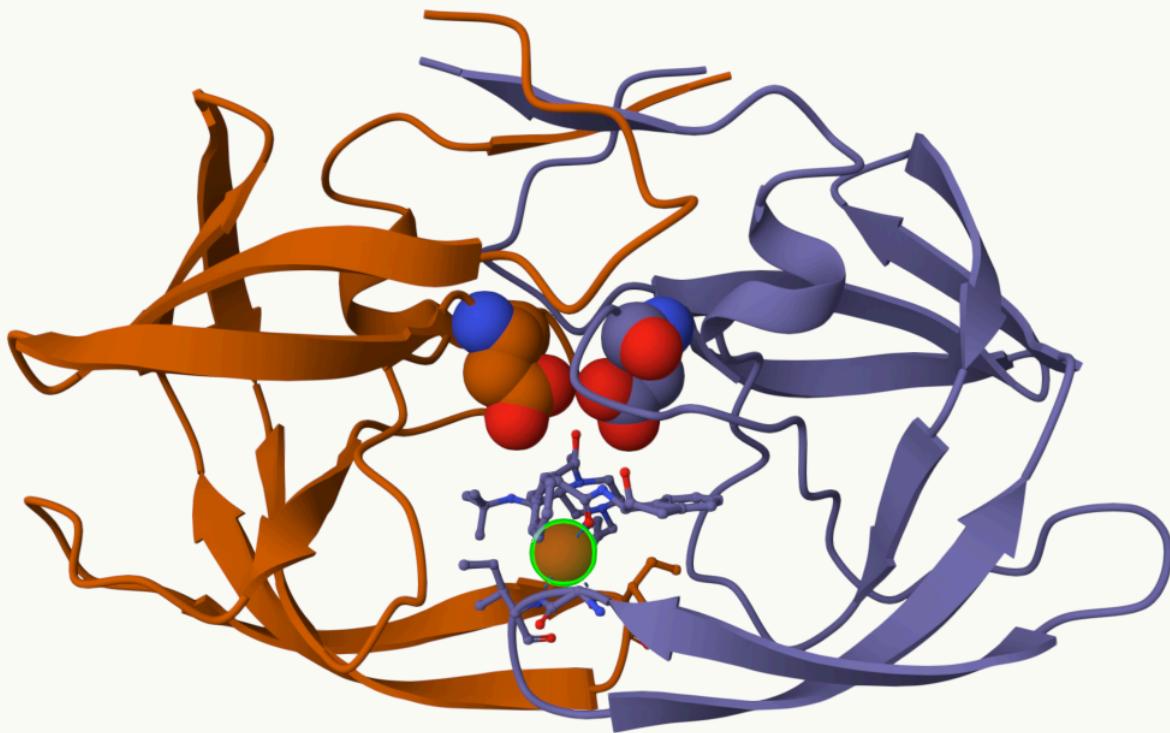

Q4: Water molecules normally have 3 atoms. Why do we see just one atom per water molecule in this structure?

We see only one atom per water molecule because only the oxygen atom is resolved and included in the structure; the hydrogens are omitted since they're not visible at typical crystallographic resolutions. Their absence also helps to minimize clustering and improve visibility.

Q5: There is a critical "conserved" water molecule in the binding site. Can you identify this water molecule? What residue number does this water molecule have

Residue number: HOH 308

Q6:

Q7: How many amino acid residues are there in this pdb object?

198

Q8: Name one of the two non-protein residues?

HOH (water) and the MK1 ligand.

Q9: How many protein chains are in this structure?

There are 2 chains: A and B

## PDB objects in R

```

```
chainA_seq <- pdbseq(trim.pdb(hiv, chain="A"))
```

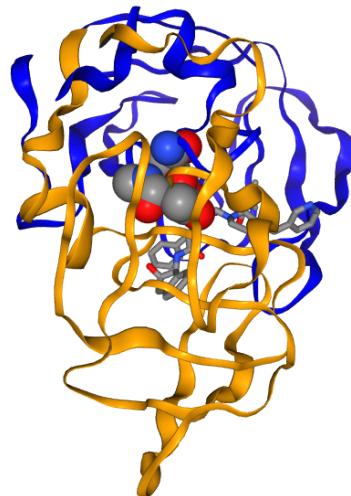

I can interactively view these PDB objects in R with the new **bio3dview** package. This is not yet on CRAN.

To install this I can setup **pak** package and use it to install **bio3dview** from GitHub in my console.

```

library(bio3dview)
sel <- atom.select(hiv, resno=25)
view.pdb(hiv, highlight = sel,
          highlight.style = "spacefill",
          colorScheme = "chain",
          col=c("blue", "orange"),
          backgroundColor = "pink")

```

```
install.packages("bio3d") install.packages("NGLVieweR")
install.packages("pak") pak::pak("bioboot/bio3dview")
install.packages("BiocManager") BiocManager::install("msa")
```

Q10. Which of the packages above is found only on BioConductor and not CRAN?

The msa package is only found on BioConductor.

Q11. Which of the above packages is not found on BioConductor or CRAN?:

bio3dview; it was installed from GitHub using pak::pak("bioboot/bio3dview").

Q12. True or False? Functions from the pak package can be used to install packages from GitHub and BitBucket?

True

## Predict protein flexibility

We can run a bioinformatics calculation to predict protein dynamics - i.e. functional motions.

We will use the `nma()` function

```
adk <- read.pdb("6s36")
```

Note: Accessing on-line PDB file  
PDB has ALT records, taking A only, rm.alt=TRUE

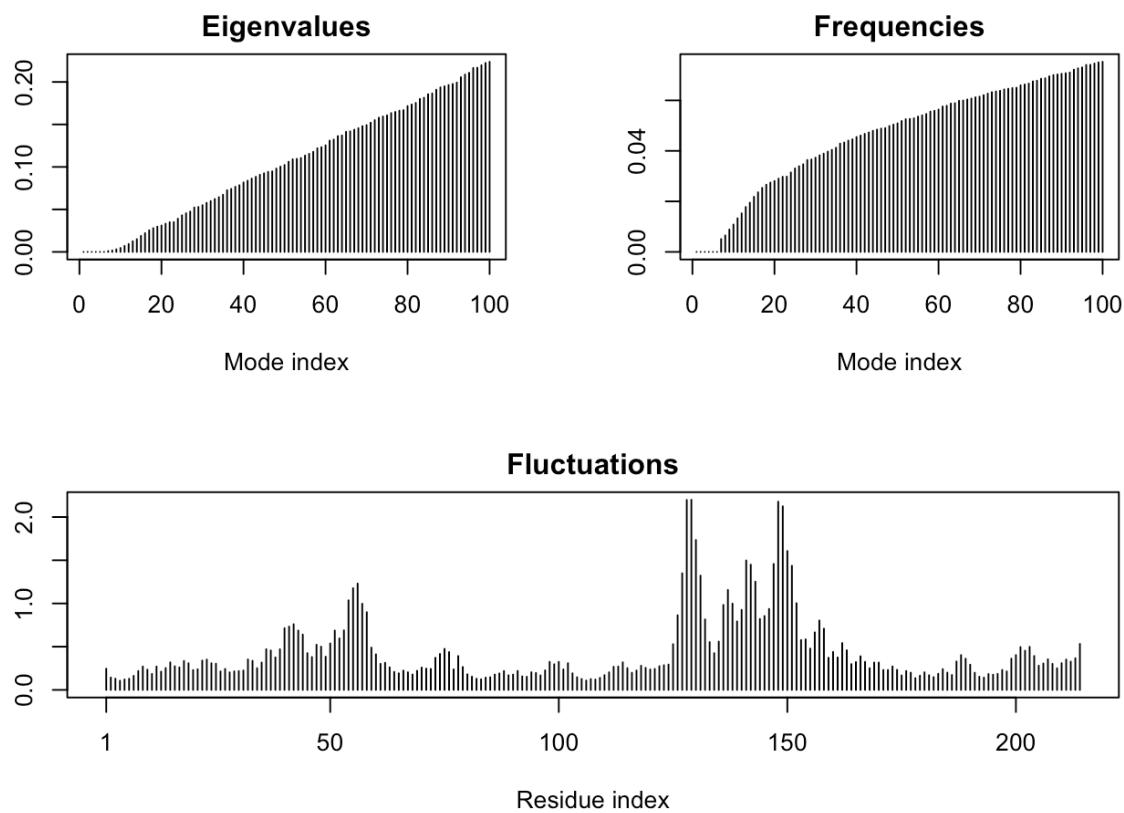

```
adk
```

```
Call: read.pdb(file = "6s36")

```
fasta
```

Alignment dimensions:

1 sequence rows; 214 position columns (214 non-gap, 0 gap)

+ attr: id, ali, call

Q13. How many amino acids are in this sequence, i.e. how long is this sequence?

214

## Normal mode analysis

Blast or hmmer search b <- blast.pdb(aa)

Plot a summary of search results hits <- plot(b)

List out some 'top hits' head(hits\$pdb.id)hits <- *NULL* hits\$pdb.id <-
c('1AKE\_A','6S36\_A','6RZE\_A','3HPR\_A','1E4V\_A','5EJE\_A','1E4Y\_A','3X2S\_A','6HAP\_A','6HAM\_A','4K46\_A','3GMT\_A','4PZL\_A')

Download related PDB files files <- get.pdb(hits\$pdb.id, path="pdbs", split=TRUE, gzip=TRUE)

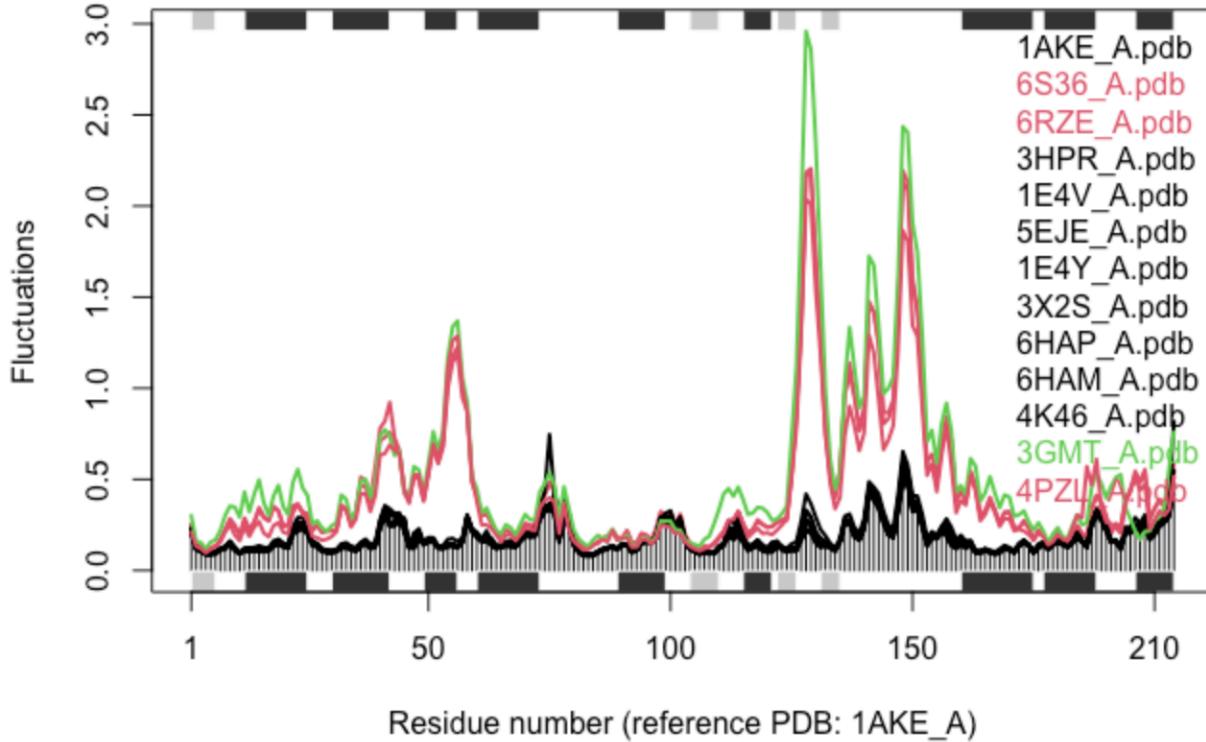

Align related PDBs pdbs <- pdbaln(files, fit = TRUE, exefile="msa")

```
Vector containing PDB codes for figure axis ids <- basename.pdb(pdfs$id)
```

```
Draw schematic alignment plot(pdfs, labels=ids)
```

```
NMA of all structures modes <- nma(pdfs)
```

```
plot(modes, pdfs, col=grps.rd)
```

Q14. What do you note about this plot? Are the black and colored lines similar or different? Where do you think they differ most and why?

The plot compares the flexibility (Fluctuations) of several protein structures across their length (Residue number). The main observation is a stark difference in flexibility between two groups of structures.

The red and green lines show much higher fluctuations (peaks up to 3.0) than the black lines (peaks rarely above 0.5). This means the proteins represented by the colored lines are significantly more flexible and dynamic.

Despite the difference in size, both the black and colored lines show peaks at the same locations (around residues 50-60, 125-145, and 150-160). This indicates that the same protein regions are the most flexible in all structures.

The lines differ most dramatically in the regions of highest movement: Residues 125-145 and 150-160. This may be because the black lines represent the structures in a closed/ligand-bound state where the ligand "locks" the loops in place. The red and green lines may be the open state/without a ligand, allowing the loops to move freely and leading to larger fluctuations.
